

Apache Pulsar

A simple **Apache Pulsar** project that demonstrates a basic setup of message production and consumption using Apache Pulsar, where messages are produced by **producer.py** script and consumed and processed by **consumer.py** script. In detail:

producer.py : Sends each word from a user defined input as separate messages to a Pulsar topic

consumer.py : Subscribes to the Pulsar topic, receives each message, applies the conversion, and prints them along with their message IDs. It then acknowledges each message.
